Enset (Warqe) Production and Use in South Shewa Zone of Wonchi District

Desta Amare

Abstract

The main purpose of this research is to describe and analyse the cultural ways of warqe production and its uses. For this research, interviews and observation data collection methods are implemented. According to the collected data, Enset(Warqe) is the stable food and the main harvest of the South West Shewa Zone people of Wonchi district, the study area people farm different types of warqe plant, produce a variety of cultural foods, and use its by-product for many purposes. More than any other section of the community, women have been able to capitalize on the fruits of Enset production. They have used it not only as a food source but also as a source of income. During the production time, women are employed as day labourers and use the money they earn to buy and exchange different materials, and more importantly to take care of their family. On the whole, this study revealed the indigenous knowledge of ways of warqe production practiced by the people of the study area, the traditional instruments used in the production, warqe as cultural food and the use of warqe by products. Future researches should emphasize on improved technology evaluation including processing instruments, the way of processing including keeping fermentation area sanitary, and identifying fast growing types of enset (warqe) in order to boost productivity of enset (warqe).

Key Words: Enset (Warqe) Cultivation, Production and uses
Introduction: Enset is the name given in Amharic language for the plant known in the science of agriculture as ventricosum. This plant seems like banana, and it is even sometimes called by the name of false banana. Enset is mainly grown in the south and south west region of the country. It is known by the name of Warqe in the enset farming zones of Oromia region, particularly in the Wonchi district. (Brhane G/mikael, Urji Ijeta¹), Tariku and Mogessie also address it by the name of warqe in their study (2011).

This plant, as different literatures point out, is used as a stable food by about 20 million Ethiopians, especially for those who are found in the southern and south western part of the country (Abrham Shumbulo and et al 2012, Admasu and P. C. Struik 2002). Stone, Amanda, et al.20011 has stated that, enset in other parts of the world has been seen as an ornamental plant, while it has been a stable food in Ethiopia for roughly 5,000 years.

As my informants² explicitly told me, Enset by its nature keeps water in its stem for a long time; this makes it a very important drought resistant crop. It also looks like an evergreen plant. People who are familiar with its farming culture and use it as their stable food have food security that can be sustained more than that of other cereals’ farmers. Because of these natural features and its production, Enset can resist drought. As such, it is called by some researchers as “hunger fighting tree” or “tree against hunger.”(ibid)

¹ The first hand data collected from the three warqe cultivation plots on the contexts of planting, hoeing and production through interview and observation
² Informants in planting affair 1) Urji Ijeta he is a farmer ,his age 83,live in Waldo Talfam kebele 2) Turuneh Urji he is a farmer,his age 40,live in Waldo Talfam kebele3) Gutema Uquba, he is a farmer .his age 65 he live in Fittewato kebele.
In production affair 1) Brhane G/mikael, , she is a farmer, her age 35, live in Waldo Talfam kebele 2) Sileshi Dirribsa, she is a farmer ,her age 50,live in WaldoTalfam kebele 3) Hirphitu Likkisa,she is a farmer, her age 45 ,live in Waldo Talfam kebele
Enset or warqe is a multipurpose plant of which every parts of it can be used not only for food but also for different economical and cultural purposes. It is also used as animals forage. According to Belachew and et.al (2017) there are various types/varieties of enset. These different types of enset are known in different areas by different names.

As the informants in the study area have clearly stated, there are six types of warqe. The types of warqe are known by the names of Badadeettii, Farasiyee, Sabbaaraa, Awwanyi, Absaaratii and Bashalgaa. These warqe/enset plants are different in colour and size. For example, as mentioned by informants, the Bashalga types of warqe, the late comer for the area, is tall in size, ripe more quickly than the others, and the warqe dough produced from it, is relatively white in colour more than the others.

According to the information given by the informants, due to its colour, this type of warqe dough is attractive and needed for market purposes.

According to literatures, many researchers have studied enset/warqe focusing on the southern part of the country, especially SNNPR, from the perspective of agricultural scientific applications and its natural capability in keeping food security sustainable, with the exception of Dereje and Endale(2003), Tariku and Mogessie (2011) who have done research on West Shewa. However, the former studies did not emphasise on cultural ways of plantation, food preparation and other cultural activities regarding warqe.

Therefore, the purpose of this research is to describe and analyse the cultural ways of warqe plantation, production, and its use in order to depict indigenous knowledge of the community under study.
Research area description

Wonchi is one of the woredas/districts in the Oromia Region. It is located in the South Western Shewa Zone. It is bordered on the south west by Amaya, and its administrative centre is Citu. There are other emergent small towns like Dariyan and Haro. Wonchi district has volcano made mountain, and there is a Crater Lake at its centre, which is known by the name of the district– Wonchi. In the lake has two islands. One of them includes the Cherkos monastery. Tourists and other people who want to visit the monastery can navigate on local boats. Due to this distinctive natural landscape, Wonchi district has been a destination for tourists. In addition to being one of the most valuable hubs of tourism in the country, the culture of the people in the area is distinctive. They invite guests in a lovely manner by saying “Anatti haadhufu,” its direct translation is “something will come to me.” It is the way, they express their affection through.

The major crops grown at the study area are, teff, wheat, barley, maize and sorghum for cereals and field pea, house bean, Chick pea and lentil from pulse are the major types of crops produced. Warqe/Enset is also widely cultivated in Wonchi District. The livestock husbandry is also one of the means of livelihood of the people in the study area. Wonchi District has the diversified different livestock population these include cattle, sheep, goat, horse, donkey and Bee rearing for honey production. Livestock are essential components of warqe culture both in terms of supplying farmyard manure and in provision of milk and meat without which consumption of warqe products would be difficult. Regarding this there is a proverb “Foonan sodadha jedhe warqeen” its meaning is ‘Warqe said I fear meat.’ That
means when warqe eaten with meat become delicious and nobody leave its remains on his/her serving dish. From this point of view, the study area has various cultural foods that are prepared from warqe, which are unique to it and make up the stable part of the food for the community.

According to the 2007 national census report, this district had a total population of 93,624, of whom 46,915 were men and 46,709 were women, while 2.04% of its population were urban dwellers (CSA 2007:11). As documents show, majority of the residents practised Ethiopian Orthodox Christianity, which numerically accounted for 70.12% of the district. I can also deduce from my observation that the number of Protestant followers is rising, but, in the statistics data, they numerically accounted for 28.41%, while only 1.28% were Muslims, and the Traditional and others accounted for 0.17% (Ibid: 289).

Method of the study

For this study, qualitative research method is applied. The term qualitative implies an emphasis on examination of the processes and meanings, but not measured in terms of quantity, amount, or frequency (Labuschagne, 2003). Therefore, this study focuses on qualitative part; that is, the result of discussion made with people regarding processes of warqe planting, production and its use.

In this qualitative method based research, data has been collected through interview, observation and document analysis. In literature, there are different kinds of interviews. For this study, semi structured interview is
applied because it helps researcher to collect only the necessary data that researcher want.

The informants have been selected for interview by purposive and snowball sampling. Based on this mechanism, three men and three women selected. After a while, the collected data is classified and prepared for analysis.

**Literature on the concept of food**

As stated before, enset is multipurpose crop; its main purpose is as a food for human beings and animals. What is food? How has it been selected? How can it be a shared value indicator? And how can it be sustainable?

From the regular point of view, food is a necessity. Without food, nobody can live. This is science. When we look at it from a different perspective, the ways of preparation, the ways of cooking, the ways of serving, and the ways of production and choosing food type based on ecology and financial capability depend on culture and religion. Different studies also support these facts. As Yohannes (2006:1) points out in his article,

> Every society has food menus of its own depending on the prevailing culture of food production and/or acquisition. The types of plants and animals, which serve as sources of food are dependent on the climatic conditions or generally, the ecosystem characteristics of an area and the traditions of selection of crop and animal types.

Moreover, food has meaning; it is associated with different things and conveys so many messages. Regarding this, Anderson (2005: 125) states as follows,

> More generally, food has its own meanings. Everywhere, food is associated with home, family, and security. One main message of
food, everywhere, is solidarity. Eating together means sharing and participating. The other main message is separation. Food marks social class, ethnicity, and so on. Food transactions define families, networks, friendship groups, religions, and virtually every other socially institutionalized group. Naturally, one group can try to use food to separate itself, while another is trying to use food to eliminate that separation. It also carries messages about status, gender, role, ethnicity, religion, identity, and other socially constructed regimes.

Due to these multidimensional aspects of food and food preparation ways, different scholars have been studying food in multidisciplinary approaches. In the research of Mintz, and Christine (2002) as stated, Claude Levi-Strauss (1965) and Mary Douglas (1966) have made important contributions to a structuralism vision of food and eating. This structuralism view of food was implemented in the identification study of rules and conventions that govern the ways in which food items are classified, prepared and combined with each other, Beardsworth and Keil in the research of Vlaholias (2012). Munn (1986) also focused on symbolic value of creation in food, Sutton (2001) did research to show the social construction of memory through food, and other researches had studied food from the perspectives of functionalism, religion, status, gender and so on.

In this article, data analysis is made by using structuralism and functionalism at the condition it coincides with farming, producing warqe dough, preparation of warqe food types (cultural), business carried out with warqe, and the role participants (especially women) play in all processes. At the same time, the role warqe and its byproducts play is analyzed through the functionalism approach.
Data analysis

Cultivation process

Planting warqe has its own unique way. According to the information which is gathered through interview from the informants and observation at the plot hoeing context, it starts by propagation, which means creating newly growing warqe/enset plant. For doing this, first immature warqe, which is locally known by the name Iyyibaa, is uprooted, and then it is cut at the area a little bit far from its corm. This process is known as “Naddoo muruu”. After it has been cut, the newly growing bud should be removed, filled by soil, smeared on it manure, and buried in a well prepared hole. This cutting and burying takes place in the month of November, especially in the Ethiopian Calendar from Hidar 15 to 30. Within the first year, many buds are grown up. These are called ilmaan naddoo. That means Naddoo’s children. After a year, Ilmaan naddoo will be transplanted and replanted in another place. This process is known by the name of “ilmaan tamsaasu,” which means scattering warqe shoots line by line. This process involves planting, preparing an area for this work, digging hole, and adding manure.

---

3 Gutema Uquba he is a farmer, live at Fittewato Kebele, age 65, Turuneh Urji, he is a farmer, live at Waldo Talfem kebele, age 40
Through giving continuous and considerable follow up of two years, it is grown up to the stage known locally as “Masiyee.” Two years after that, its place should be changed and named “Iyyibaa”. In between one or two years, it needs hoeing, for removing weeds or turning over the soil in that plot. After two years, its place should be changed again. This process is done fully by using the same areas; it doesn’t need a new place. That means, at the place where matured warqe is rooted up, the “Iyyiba” would be planted. (It would be planted in the hole matured warqe was uprooted.) Then, it is left in the same place for four or five years in order to enable it to mature to the warqe stage.

As informants at the study area have stated, the evolution from the seedling or propagation stage to matured warqe stage takes 12 to 14 years. Therefore, warqe plantation/farming is a time and labour consuming business. Up to the maturing stage, there are different activities that have to be done. These include weeding in season, hoeing deep in one or two years interval, tying the leafs together in line so as to permit them to grow in well condition, pruning the leaf for different purposes (encouraging for fuller growth or for letting it to dry and use it as fire wood), and adding dung and other plant nourishment materials. No one can do these all activities alone. Therefore, in addition to the whole family members’ participation, the community should form cooperative bonds which are known by the name of daadoo and daboo. Dadoo means working for each other in a mutual way. Daboo is the method of working for one person in group for one day. Regarding these work style concept, Bartels (1977:497) defined as follow,

Dabo is a one day's cooperation between 10-40 people, or even more, convened by a man who needs their help in e. g. ploughing and sowing, reaping, clearing, the making of a road, the building
of a house, and the like. Dado is a form of long-term reciprocal cooperation on equal terms between a smaller numbers of people who work in turn for each other.

These cooperative bonds or unions help for simplifying such tough works.

In these plantation processes, men take the lion’s share, while women also provide supporting mission in serving food during the plantation, hoeing deep and transplanting occasions for those cooperatively assisting them - “Daadoo” members. At this plantation stage, weeding, adding dung continuously and hoeing by simple digging tool (turning over soil) is also done by women.
Types of Enset (Warqe)

In the study area, there are a variety of warqe plants. These are 1) Badadeettii is white in colour and needed more than the others 2) Farasiyee –this warqe plant is red in colour. Most of the time this type of warqe is used for home consumption because of its unattractive dark colour in market; otherwise, it should be mixed with remaining types during production 3) Sabbaaraa:- this type of warqe’s amicho4 is needed for its medicinal purpose. According to the study area people belief, when the one who has broken his/her body bone eats this warqe plant, boiled amcho (corm) with skimmed milk (Baaduu), then his/her bone can be maintained. 4) Awwanyii, 5) Absaaraatii 6) Bashalgaa. According to informants, this

---

4 Amicho is lower/bottom part of warqe stem
sixth warqe type is a late comer and matures in a shorter time of plantation seasons than the other types.

**Production process and tools**

In the culture of warqe farming, the planting stage is followed by the production stage. Warqe production includes cutting, scarping or scratching the sheath of warqe upper stem (inner leaf) with the tool “sibisa”. This sibisa, which is used in scratching, is made from bamboo plant.

Chopping and beating the corm part of warqe with the tool “Jaawga” is also another warqe production process, and the rest is squeezing the scraped and the chopped corm together so as to obtain the starchy type of warqe food raw material which is known in Amharic as Bula, locally called “Hamxiixii.” The other production activity is fermenting. For fermenting warqe, yeast is necessary. For preparing this yeast, different spicy and medicinal plant leafs are collected, sliced, and mortared. Then the stem of matured warqe fruit stem, which resembles banana and locally called “firee,” is added and mixed together, then the mixture is left for a month placed in the hole of corm, where corm knocked out and covered with warqe leaf tightly.

Starting from the warqe production stage to food preparation and taking to market stage, every duty demands women’s undivided participation. There
is no men’s involvement, since touching warqe dough is taboo for men. Because at the study area touching warqe dough is equal to baking in kitchen; baking is work division given for women according to the culture they perform. But those men, whose life is based on warqe trading, do their business after the warqe is wrapped well (tying in “jambi” form) by women, carrying it on horse and donkey backs.
The Role of Women in Production Performance
Enset (Warqe) Production and Use…- Desta Amare

Warqe production is a labour and time consuming process. Before planning production time, first the matured warqe plant should be identified. Identification is done based on the maturity indicator, which is the emerging of warqe plant in the same way a fruit emerges for banana. As mentioned above, the main activity at the production stage of warqe belongs to women. For this job, women always plan because it can’t be done alone. It needs cooperatively organized body. Culturally, the production of warqe at the study area is performed in the months of May, June, July, August, September and November. Therefore, women should take these months in consideration while planning their worqe production duty.

According to informants, all warqe farmers at the study area have cooperative organization called “Daadoo.” The members of this organization propose the month they prefer for production; through discussion they amend according to their own mutuality. The actual production will be performed on the day working is permitted according to the rule of Orthodox Christianity. Nevertheless, nowadays those who are not the follower do their plan at a day they want.

When the proposed day comes to close, the production owner prepares food and coffee to serve to the”Daadoo” members, giving them new information and reminding them the date of production.

On the production day, in the home of the production owner, all activities focus on the programmed warqe production, especially children and female family members need to cooperate with “daboo” members. The activities will be performed as follows:

The first main activity is cleaning and preparing the working area. This includes lining the pit, decorticating and thumping warqe. This pit is used as
depot and fermenting container. This is done for protecting it from any contamination and leakage.

Preparing production instruments, such as Waatani, Sibissaa, Jawgaa, Aaduu/ Billaa, different containers like bucket, and filtering materials locally called Gingilchaa, division of work: well experienced women in decorticating are identified and grouped with their assistants; the assistants do cutting and peeling of the outer cover of warqe sheaths.

Three to five young girls are grouped together for beating/thumping corm part of warqe: “ammichoo”. One or two women will be assigned for digging the part under the stem of corm from the hole, from which matured warqe is uprooted. This is done by the instrument jawga. Its output is amicho, which will be mixed with decorticated warqe sheath, and the hole can be used for fermenting the yeast which is called Gammaa.

During the production of warqe, as researcher has observed, the leader of the performance will be the owner of that programme (the warqe farm). As have observed, she participates in every activity. Providing working instruments, uprooting the matured warqe, participating in the above mentioned groups as an assistant, and providing food and coffee at lunch time are under her responsibility.

After the above mentioned arranging activities are completed, the practical production work will start. At the plot researcher visited, the Daadoo members are comprised of ten women and the owner. The first activities they perform are uprooting one of the matured warqe and pulling it to the production area. This part of the performance is very hard because the uprooted warqe plant is weighty and the land in between each warqe plant is not comfortable for transporting. Then, the upper part sheath is removed
and collected to one place for animals forage, and the next two layers are peeled and given to two women for decorticating job. Their two assistants prepare these sheath layers/pseudo stems (qalchaa) by uncoiling and splitting the sheath leaf longitudinal so as to fit it to Watani.

These layers, as researcher observed, are different in colour; as the locals call it, those colours are white and light brown, locally named as Adiifi magaala (white and brown). The so called Adii has strong fibre, which is exposed when decorticated with the instrument Sibissaa. The Magalaa one is soft and has no fibre as that of Adii; they call it hoffaa. Those two women assigned for decorticating work share these two colour sheaths, while doing their jobs separately. The woman who decorticates the Adii one produces fibre which is called, “Qaancaa” in addition to “future warqe dough.”
Fig. 8 During decorticating and pulverising time

The remaining fragile interior sheath and attached corm locally known as amichoo is pulverised by the instrument jawgaa; this work is very hard and done in group by younger girls.

Fig. 9 jaawgaa

The other two women will tamp the unmoved corm part of warqe with jaawgaa and make a hole for fermenting yeast in it.

The other group of women put the decorticated Adii and pulverised corm in to sack and squeeze for producing the liquid part of warqe production,
which is known in Amharic as Bula, and in Afaan Oromoo as Hamxiixii. The squeezed solid part, the remaining adii, the pulverised corm and the decorticated light brown– Hoffa– are together placed in a well lined pit and wrapped tightly with warqe leaf.

One or two women prepare yeast for fermentation purpose. The ingredients collected from different spicy and medicinal plants will be chopped and mixed with pulverised amicho. Then, they will be wrapped with warqe leaf tightly. The yeast that is used in this process is locally known by the name of Gamma.

This warqe production process might be done in just one or two consecutive days by one family. In these days, 10 to 15 warqe plants might be decorticated. The main works that have to be done in general are: cleaning the working area, cutting and pulling the matured warqe plant to the decorticating area, pilling the sheath for decorticating, decorticating in different places according to the colour of the warqe sheath, pulverising and thumping amichoo, squeezing bula, preparing the yeast “Gammaa” and other supportive works. One family usually does the same work twice a year, but there are also some families that do it once.

After the above mentioned duty has been accomplished, the productions, which had been filled in the pit and kept as yeast, stay there for a month until they ferment. In general, the output of this production is the future warqe dough, bula /hamxiixii, and ammichoo. Ammichoo can be eaten at the time it is produced by boiling it.

When the fermentation process is over, the warqe which is placed in a pit and corm hole that contain gamma should be opened. After the covering part is discarded, the gamma is added to the warqe dough in the pit, mixed
well, and wrapped tightly with new warqe leaf. This mixing, performance known by the name warqe makaa. Again after two weeks, it will be opened and allowed to mix; at this time, it could be baked and eaten. This second time mixing performance also known by the name warqe dhiita (dafqu). This means, thoroughly mixing. Preparing it for baking needs another process. This process is beating the dough with slaughtered ox’s right hand bone, which is known locally as “Ceekuu.” This is done to separate the warqe dough from fibre, and again for removing the remaining dough from the fibre. It should be washed with pure water and filtered. This process is locally called “takasaa dhiquu.”

The separated and filtered dough is poured together in a plastic sack and kept upside down for slow going squeezing, or it is placed in well lined and wrapped pit. These types of production can keep on happening for a year.

In general, from this laborious warqe production, the farmers yield: Amicho (instant food at production time), 5Bullaa for porridge, and warqe dough which could be accumulated for a year or above for the purpose of making the warqe cultural foods- Qumusii, Hollata, and Unkuroo.

**Warqe as material culture**

In folklore classification food is one genre of material culture. It is the basic necessity for every living thing to survive, grow and strengthen physically and mentally. Every society has its own food menu depending on its culture, religion, ethnicity and ecological system. In Ethiopia, there are different ethnicities, and they are used to various types of cultural and ecological based foods which are different from each other. Oromo is

---

5 Bullaa can stay for one year or more after it is changed to powder through concentrating process
among these ethnicities. Oromo accustomed food culture mainly based on animal dietary and cereal. People in the centre and south west of the Oromia region, and high and medium land areas cultivate warq/ enset in addition to different cereals. From this multipurpose plant in these areas, there are different daily and occasional warq cultural foods that are prepared.

In the study area of Wonchi district, five kinds of cultural foods could be prepared from Warq. These are: 1) Amicho 2) Qummusii 3) Hollataa 4) Unkuroo 5) Marqaa Hamxiixii (Bula porridge). These foods in the study area have their own cultural places and time or occasion. Let us see them below in detail:

**Amicho:** is an instant food product which is prepared from warq/enset’s lower part of corm at the day of production. Its preparation is very simple. The corm is cut into small parts and boiled in pottery jar/pot or in a pan with little salt and is then eaten with pepper spices. As informants told me, amicho is obtained from the sabbaraa type and is needed for its medicinal quality. For example, according to my informants’ statements, the one who has broken his/her bone, eat sabbaraa warqee’s amicho with spiced Baaduu (skimmed milk) and fill up his/her stomach well and suck pepper smoke and sneeze out. Then the broken bone is believed to come back to its place. Amicho is not a permanent or stable food; it is eaten just at the production moment for one or two days. It is an unusual food in that respect.

**Qummusii:** this food is eaten everyday in the study area. Before describing the content of this food, the word “Qummusii” should be defined. Qummusii is an Afaan Oromo word. It means mixed. This name is given for the food Qummusii based on the characteristic of the ingredients of the food. That is warq, as mentioned above, is a time and labour consuming
product; it can’t be produced simply now and then as it needs saving. Therefore, the people in the study area are involved in the saving of the warqe product for a long time so as to use it for their daily use baking; they mix warqe dough with grain flour especially with barley. They can use the warqe bread which is baked at once to be used for a long time from three days to a week; for example for students who will learn in towns far from their village, they add to their luggage the same bread. So for preparing this type of warqe bread, Qummusii in addition to grain flour is added and mixed with different spices and salt. If the chance of getting stew is improbable, they can eat qummusii barely and drink water. When it is baked, there is no need of covering it with warqe leaf as Hollataa.

Hollataa: this food is occasional; it is prepared for guests and different occasion participants, for instance marriage, funeral, get-together and other main cultural activities. The warqe dough of Hollata should be well prepared and kept, and its colour should be white. Its baking also demands rich knowledge of cooking warqe bread and careful attentions. When it is baked, it is wrapped well by warqe leaf. After baking, it has two colours; that is, the outer cover seems water and the interior part becomes pure white. These characteristics show its quality.

This quality type of warqe food is eaten with well prepared minced beef, which is called kochee in Afaan Oromoo and kitifo (in Amharic). The ingredients of Kochee are minced beef, clarified butter, cardamom and mitmita. Boiled beef stew is also another cuisine which could be eaten with Hollataa.

The second stew eaten with Hollata is the spicy cottage cheese. It is known in the study area in different names according to its mixture. Those are 1)
“Arafraaati” cheese with spice, butter and powdered cabbage, 2) “Argoo” cheese with butter, spice and shiroo, 3) “Ittoo” cheese with butter and “mitimita” or without any spice.

The third stew eaten with Hollataa is cabbage spiced with butter. This type of serving shows the status of the server.

**Unkuroo:** This warqe food is also occasional. It is prepared for guests in the previous time. Most of the time, it is prepared for husbands as breakfast. Nowadays, all family members can feed it for occasions. Unkuroo is prepared from the mixture of warqe dough and bula. The ways of cooking Unkuro is different from baking hollata. That is, after warqe dough and bula are mixed together, the mixture is poured on hot plate and would toast thoroughly by string. Then, different spices like cardamom, mitimita, spiced butter, and cheese or cottage yogurt are added. As informants told me and as I also know from previous experiences, the one who eats it in the morning can stay for a full day without additional meal. This food, most of the time, is prepared for breakfast.

**Marqaa Hamxiixii (bulla porridge):** As stated above, bulla is obtained from decorticated white milky warqe inner pulp and chopped or pulverised corm through squeezing and concentrating. Hamxiixii (bulla) porridge is cooked most of the time with milk, and at the end butter should be added. It is prepared for breakfast for children, elders, and nursing mothers. It is also served for patients who have digestion problems. In porridge cooking, it can be mixed with other types of flours for its softening characteristics.
Warqe as income generating for women

Women make essential contributions to the agricultural and rural economies of all regions of the worlds (FAO, 2011). According to this FAO research paper, the roles women play in agriculture are varying and change rapidly because of the transformation of social and economical forces in agriculture sector. But in developing countries, especially in Africa, where rural life has become miserable, women always manage complex and difficult households. Every activity in the house and out in the field needs to be accomplished through poor technology by women; we can almost say everything is done by hand. Especially at the study area, according to the information researcher gathered, women in any agricultural activities including warqe cultivation participate tremendously without rest; their activities include assisting men during ploughing, and at the time of weeding and harvesting. They carry out main jobs independently in addition to assisting.

When we come to warqe/enset farming, all things except soil preparation, plantation and transplantation are done by women. The tedious works of weeding, harvesting, and processing for food and sale are the responsibilities of women. In addition to this tough work, they are also expected to nurture the day to day life of their family: they plan food budget for the year based on their warqe yield. In this case, if they have surplus, they will bring some of it to market for selling. The money and materials they collect from trading warqe sponsors them for fulfilling their needs, for example collecting raw materials for stew such as salt, oil, spices and their yearly costumes and others.
In this study area, women use warqe as money. That is, at the small markets, Darian and Warabu, as I have observed, women who want to buy salt, spices, coffee, soap, oil and other small amount of necessary things don’t need to have money; they carry some amount of warqe dough to the market and put a small amount of it on their hand and will ask traders in market for exchange in a bartering way with the material they want. This type of marketing is traditionally known by the name of Qexoo. This way of trading goods has transferred from generation to generation, and it is still, now, an active marketing system for the study area regarding warqe dough. Through this system, the traders collect warqe dough from different small sellers and will prepare in Jambii form for extensive markets.

The women who are experienced in decorticating, pulverising and assisting in different ways of warqe production are employed for daily labour under those women who have the warqe production programme. This is also another income generating system for the poor women of the study area. This type of women’s activity has dual purpose; one is earning money, and the second is covering that day’s cost of their meal. This is because the one who employed women for warqe production daily labour should cover their meal in addition to the payment they give.

Regarding warqe trading, as mentioned above, women traders of the study area whose trade is based on warqe products head their job in different ways. They do this by trading different spices and cereal they assemble for warqe/enset dough in large quantity from different women by bartering system, and they sell it for other merchants.

The women who produce surplus warqe dough and bulla beyond their family consumptions sell for traders at their home garden or by taking to the
market for money. Those who bought bulla and warqé dough from garden yard sell it again by adding value, meaning after they have changed it to powder through different cleaning and drying process, they laminate it with plastic and take it to city markets. This is especially done for bulla. Then the material is provided to supermarkets. In the case of warqé dough, after they are collected from different rural small market through bartering and buying by money, they are prepared in “jambii” form- big pack of warqé for larger markets like Waliso and Merkato.

Others, who have mini restaurants near their home, which is located at small town, prepare warqé bread, Hollataa, with different spicy stew like Kochee (kitifo), Ittoo (cottage cheese) and Rafuu (cabbage). Customers can be served according to their interest and their capacity to buy.

According to the information that has been collected nowadays in the study area, some women have started trading in the same way as mentioned above in the place called Darian (in rural small restaurants).

In other way, women of the study area could be involved in other ventures in addition to taking warqé dough and bulla to market so as to fulfil their daily needs. Those who have the talent of making different type of mat and basket from warqé part— oficho and qacca (fibres)— could produce and sale with the aim of improving their income.

In the production processes, other than obtaining warqé cultural food raw material, warqé fibre could be yielded, which is used for making rope, mate, and basket. In addition to, its leave used during production time for wrapping the warqé pit, for covering chat or “jimaa”, for baking traditional bread (Difo) and warqé Hollata and also used as plate at ceremony of koche eating(minced red meat). Its outer part also used for animals’ food,
constructing and separating interior fence, as well as, its dried outer part which is known by the name Qoqosa used as fire wood.

### Conclusion

As this research indicates, warqe /enset is a unique plant in its character of resisting drought, and guarding the lives of the inhabitant of the study area and the poor holders of the small plots. Women, especially, can manage themselves and their family life by nurturing and praising it as their lives depend on this backyard field farming. They plant and transplant according to their tradition, which is transferred from generation to generation, and produce warqe dough for different cultural foods. At the study area, women have full right on processed warqe products; basically those who have surplus products can sell and make money. Those who have scarce money in hand can fulfil their daily need through bartering warqe dough with the material they require, specifically small amount of spices and stew raw materials, salt, oil and coffee for daily use.

In general for the betterment of the life of the warqe producing women of the research area, there is a need to train, and improve instruments and ways
of production in order to minimize labour consuming factors and upgrade outputs in quality and quantity.
